Dear Sir:

This office performed a land survey as per your request on May 20, 1983, the results are as follows.

There were 75 measurements performed on the property (see enclosed map). The measurements ranged from 6 to 16 microroentgen per hour (ur/hr). In comparing this property to lands evaluated previously we can estimate that approximately 19% of the homes built on this land will have indoor radon concentrations exceeding .02 working levels, the current E.P.A. guideline for remedial action.

Although there are no legal requirements, as of yet, it might be wise to consider some form of construction technique designed to reduce the influx of radon gas from the soil into the home.

If I may be of any further help concerning this matter, please do not hesitate to contact me.

Sincerely,

Harlan Keaton
Public Health Physicist III
